

Global Solution Branches of Two Point Boundary Value Problems

By Renate Schaaf

Springer-Verlag Gmbh Dez 1990, 1990. Taschenbuch. Book Condition: Neu. 235x156x15 mm. Neuware - The book deals with parameter dependent problems of the form $u' + f(u) = 0$ on an interval with homogeneous Dirichlet or Neuman boundary conditions. These problems have a family of solution curves in the (u, \dot{u}) -space. By examining the so-called time maps of the problem the shape of these curves is obtained which in turn leads to information about the number of solutions, the dimension of their unstable manifolds (regarded as stationary solutions of the corresponding parabolic problem) as well as possible orbit connections between them. The methods used also yield results for the period map of certain Hamiltonian systems in the plane. The book will be of interest to researchers working in ordinary differential equations, partial differential equations and various fields of applications. By virtue of the elementary nature of the analytical tools used it can also be used as a text for undergraduate and graduate students with a good background in the theory of ordinary differential equations. 146 pp. Englisch.

Reviews

Very useful for all group of people. It is amongst the most incredible pdf i actually have read through. Its been written in an extremely straightforward way and it is just right after i finished reading through this pdf by which basically modified me, change the way i think.

-- **Felicia Nikolaus**

These sorts of ebook is the ideal book offered. It can be written in simple terms rather than confusing. I discovered this pdf from my dad and i advised this publication to understand.
