RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 24 pages. Original publisher: Washington, D. C. : National Aeronautcs and Space Administration ; Springfield, Va. : For sale by the National Technical Information Service, 1990 OCLC Number: (OCOlc)25321965 Subject: Silica. Excerpt: . . . larger samples used, 20 g versus about 17 mg (TGA) In the incremental analysis. A cause for these minor discrepancies In the two char yields maybe due to small varlatlons In composition of the TEOS-Asamples from batch to batch. Application Evaluation Now that we have some background data on the chemistry and some important physical properties of TEOS-A and TEOS-B, we are in a position to present exam-ples of the potential use of these materials In actual ceramic processlng. The sticky, adhesive properties of TEOS-A Imply its use as a blnder for ceramic oxide powders for the fabrication of ceramic articles. In most cases, organic polymers are used for thls purpose, but an inherent objection to purely organic binders Is that their binding properties are lost after burn off and before slnterlng; thus, compacts of poor mechanical strength are produced. In contrast to the organic polymers which leave no char residue after firing, polysiloxanes derived from TEOS-A blnder deposit active amorphous silica between the oxide partlcles which allows reaction bonding via silicate forma-tlon at a relatively low temperature; thus, the compacts remain intact up to and after the final flrlng sequence. In addition, the use of polysiloxane polymers, because of their significant silica char formation, should cause less pyrolytic shrinkage than an equal amount of a zero char yield organlc blnder. The complete loss of organic blnders as volatile organic compounds shows up as a large weight loss, plus shrinkage and or porosity. For thls first appllcation, we chose Cornlng 7913...
